Bucharest Academy of Economic Studies

Abstract: Renewable energy derives from a wide spectrum of resources, such as: hydraulic energy, wind energy, solar energy, geo-thermal energy and the biomass. The extent to which renewable energies are being used has increased significantly in the recent years, as it has benefited from governmental support in several countries. Well-known institutions consider that renewable energy will become a priority issue and will play an important role in tomorrow's world, starting with the present decade of the third millenium.
